Chordate tendineae – these are chords that extend from the edge of each flap and attach to the papillary muscles that prevent the AV valves from being forced to open due to high ventricular pressure.

Papillary muscles – small nipple shaped muscles protrude from the inner surface of the ventricular walls. Papilla means 'nipple'.

Sinoatrial node (SA node), – a small, specialised region in the right atrial wall near the opening of the superior vena cava

Atrioventricular node (AV node), – a small bundle of specialized cardiac muscle cells locted at the base of the right atrium near the septum, just above the junction of the atria and ventricles.

Bundle of His – (atrioventicular bundle), a tract of specialized cells that originates at the AV node and enters the interventricular septum

Purkinje fibres – small terminal fibres that extend from the bundle of His and spread throughout the ventricular myocardium

Stroke volume (SV) – The amount of blood pumped out of each ventricle with each contraction, SV = EDV-ESV

Isovolumetric ventricular contraction – Isovolumetric means constant volume and length. During ventricular contraction, when all valves are closed, no blood can enter or leave the ventricle during this time. Because no blood leaves or enters the ventricles the ventricular chamber has a constant volume and the muscle fibres stay at a constant length.

End systolic volume (ESV) – The ventricles do not empty completely during ejection, only half of the blood within the ventricle at the end of diastole is pumped out during subsequent systole. The amount of blood left in the ventricle at the end of systole when ejection is complete is called ESV.

End diastolic volume (EDV) – The volume of blood in the ventricle at the end of diastole is known as the end diastolic volume.

Lub sound – is associated with the closure of the AV valves.

Dub sound – is associated with the closure of the semilunar valves.

Chordae tendinae – tendon like cords which are connected to the tip of the cuspid valves

Diastole – Relaxation of heart chambers

Endocardium – Inner cardiac muscle

Epicardium – outer cardiac muscle

Inter ventricular septum – Partition between right and left ventricle

Interatrial septum – Partition between right and left atria

Left atrioventricular valve – Bicuspid valve or Mitral valve

Evaluation

1. What is the function of lymph?
   a. Transport of O_2 into brain
   b. Transport of CO_2 into lungs
   c. Bring interstitial fluid in blood
   d. Bring RBC and WBC in lymph node
2. Which one of the following plasma proteins is involved in the coagulation of blood?
   a. Globulin b. Fibrinogen
   c. Albumin d. Serum amylase
3. Which of the following WBCs are found in more numbers?
   a. Eosinophil b. Neutrophil
   c. Basophil d. Monocyte
4. Which of the following is not involved in blood clotting?
   a. Fibrin b. Calcium
   c. Platelets d. Bilirubin
5. Lymph is colourless because
   a. WBC are absent
