www.tntextbooks.in

- Joints become more flexible.
- Protection from heart attack.
- Influences hormonal activity.
- Improves cognitive functions.
- Prevents Obesity.
- Promotes confidence, esteem.
- Aesthetically better with good physique.
- Over all well-being with good quality of life.
- Prevents depression, stress and anxiety.

During muscular exercise, there is an increase in metabolism. The O_2 need of the muscles is increased. This requirement is met with more oxygen rich RBCs available to the active sites. There is an increase in heart rate and cardiac output. Along with balanced diet, physical activity plays a significant role in strengthening the muscles and bones.

9.14. Bone Fracture

Even though the bones are strong, they are also susceptible to fractures or breaks. Fractures may be classified based on the

(i) Positioning of the bone ends (ii) completeness of the break (iii) orientation of the break relative to the long axis of the bone and (iv) penetration through the skin. In addition to the above classifications, all fractures can be described in terms of the location of the fracture, the external appearance of the fracture or the nature of the break (Figure 9.14).

The following are the common types of fractures,

1. Tranverse - A fracture that is at right angle to the bone's long axis.
