2. Oblique non-displaced-A fracture that is diagonal to the bone's long axis and the fractured bone is not displaced from its position.

3. Oblique displaced A fracture that is diagonal to the bone's long axis and the fractured bone is displaced from its position.

4. Spiral - Ragged break occurs when excessive twisting forces are applied to a bone (common sports fracture).

5. Greenstick - Bone breaks incompletely, just like a green twig breaks. It is common in children, because of the flexibility of the bones.

6. Comminuted – Bone fragmented into three or more pieces. Particularly common in the aged, whose bones are brittle (hard but easily broken).

9.14.1. Mechanism and healing of a bone fracture

Bone is a cellular, living tissue capable of growth, self-repair and remodeling in response to physical stresses. In the adult skeleton, bone deposit and bone resorption occur. These two processes together constitute in remodeling of bone. There are four major stages in repairing a simple fracture (Figure 9.15).

1. **Formation of haematoma**

   When a bone breaks the blood vessels in the bone and surrounding tissues are torn and results in haemorrhage. Due to this a haematoma, a mass of clotted blood forms at the fracture
