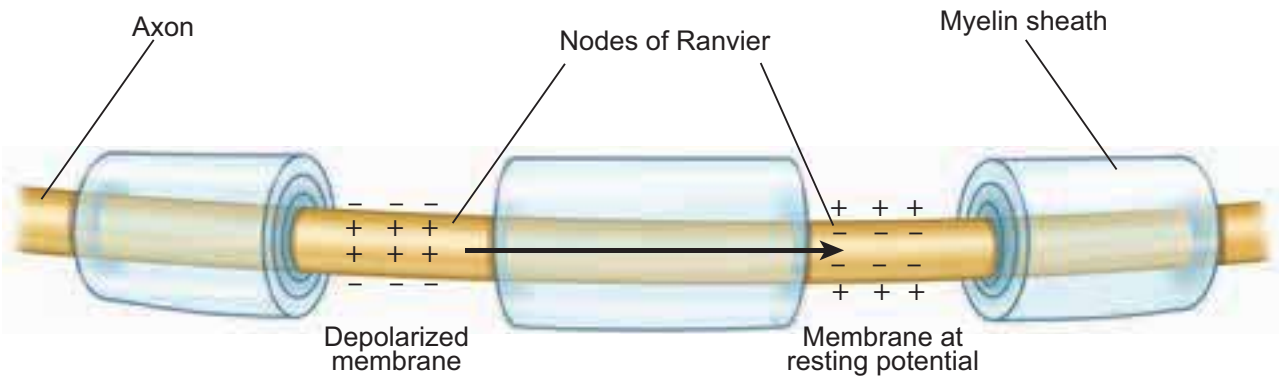

Figure 10.4 Conduction of nerve impulse

permeable to K^+ and less permeable to Na^+ ions, whereas it remains impermeable to negatively charged protein ions.

The axoplasm contains high concentration of K^+ and negatively charged proteins and low concentration of Na^+ ions. In contrast, fluid outside the axon (ECF) contains low concentration of K^+ and high concentration of Na^+, and this forms a concentration gradient. This ionic gradient across the resting membrane is maintained by ATP driven **Sodium-Potassium** pump,
