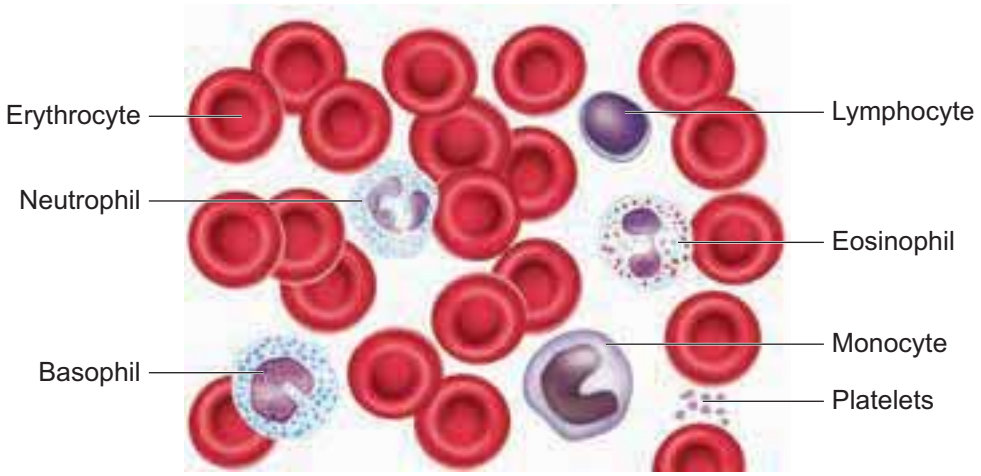

Figure12.12 Smear of peripheral blood

Differential Count

The differential WBC count is the method in which the numbers of different types of white blood cells present in the blood are counted by examining a well stained peripheral blood smear (prepared by the above method). The number of each type of white blood cell is then expressed as a percentage of the total number of cells counted (Figure12.14).

Cell	Differential Count
Neutrophil	50-70%
Eosinophil	1-4%
Basophil	0-1%
Monocyte	2-8%
Lymphocyte	20-40%
