vii) Revaluation method

viii) Sinking fund method

ix) Insurance policy method

10.7.1 Straight line method/ Fixed instalment method / Original cost method

Under this method, a fixed percentage on the original cost of the asset is charged every year by way of depreciation. Hence it is called original cost method. As the amount of depreciation remains equal in all years over the useful life of an asset it is also called as fixed instalment method. When the amount of depreciation charged over its life is plotted on a graph and the points are joined together, the graph will show a horizontal straight line. Hence, it is called straight line method.

This method is suitable for those assets the useful life of which can be estimated accurately and which do not require much expense on repairs and renewals.

Under this method, the following formulae are used for calculating the amount of depreciation and the rate of depreciation respectively:

$$\text{Amount of depreciation per year} = \frac{\text{Original cost of the asset} - \text{Estimated scrap value}}{\text{Estimated useful life of the asset in years}}$$

$$\text{Rate of depreciation} = \frac{\text{Amount of depreciation per year}}{\text{Original cost}} \times 100$$

Tutorial note

a) In the year of purchase, if the period of use is less than a year, the amount of depreciation will be charged proportionately for the period for which the asset has been used in the business.

b) If depreciation is deducted from the cost of the asset at the end of useful life of the asset the amount left in the asset account will be equal to the scrap value if there is any scrap value or it will be zero if there is no scrap value.

Example

On 1.1.2012, a firm purchased a machine at a cost of ` 1,10,000. Its life was estimated to be 10 years with a scrap value of ` 10,000. The amount of depreciation to be charged at the end of each year is:

$$\text{Amount of depreciation per year} = \frac{\text{Original cost of the asset} - \text{Estimated scrap value}}{\text{Estimated useful life of the asset in years}}$$

$$= \frac{1,10,000 - 10,000}{10} = \frac{1,00,000}{10} = ` 10,000 \text{ per year}$$
