Diagnostic features:

- Aggregate fruit develops from Single flower multicarpellary and apocarpous ovary.
- A collection of simple fruitlets makes aggregate fruit.

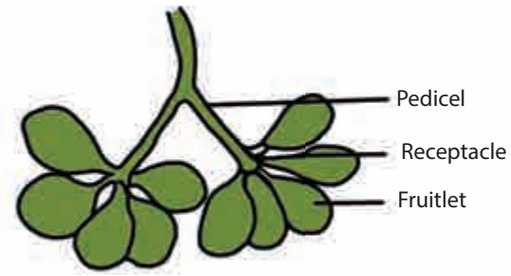

Figure 15: Aggregate fruit - *Polyalthia*

III - Identify the marked region from the given model/ photograph / picture.

Exercise: 16

Ultra structure of Bacterial cell.

Aim : To study and identify the ultra structure of bacterial cell.

Principle : Bacteria are prokaryotic, unicellular ubiquitous, microscopic organism. Bacteria contain a well developed cell structure which is responsible for some of their unique biological structures and pathogenicity. Many structural features are unique to bacteria and are not found among archaea or eukaryotes. Because of the simplicity of bacteria relative to larger organisms and the ease with which they can be manipulated experimentally, the cell structure of bacteria has been well studied, revealing many biochemical principles that have been subsequently applied to other organisms.

Requirements : Model / Photograph / picture of ultrastructure of bacterial cell.
