$\Delta H_C\,(C_2H_4)$ $= -1423\ kJ\ mol^{-1}$

Let the mixture contain x lit of CH_4 and (3.67 – x) lit of ethylene.

$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

x lit x lit

$C_2H_4 + 3O_2 \rightarrow 2CO_2 + 2H_2O$

(3.67–x)lit 2 (3.67 – x) lit

Volume of Carbondioxide formed = x + 2 (3.67–x) = 6.11 lit

x + 7.34 – 2x = 6.11

7.34 – x = 6.11

x = 1.23 lit

Given mixture contains 1.23 lit of methane and 2.44 lit of ethylene, hence

$$\Delta H_C = \left[\frac{\Delta H_C\,(CH_4)}{22.4\ lit} \times (x)\ lit\right]$$

$$+\left[\frac{\Delta H_C\,(C_2H_4)}{22.4\ lit} \times (3.67 - x)\ lit\right]$$

$$\Delta H_C = \left[\frac{-890\ kJ\ mol^{-1}}{22.4\ lit} \times 1.23\ lit\right]$$

$$+\left[\frac{-1423}{22.4\ lit} \times (3.67 - 1.23)\ lit\right]$$

$\Delta H_C = [-48.87\ kJ\ mol^{-1}]$

$+ [-155 kJ\ mol^{-1}]$

$\Delta H_C = -203.87\ kJ\ mol^{-1}$
