$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ is 8.19×10^2 at 298 K and 4.6×10^{-1} at 498 K. Calculate ΔH^0 for the reaction.

50. The partial pressure of carbon dioxide in the reaction

$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$ is 1.017×10^{-3} atm at 500^0 C. Calculate K_p at 600^0 C for the reaction. ΔH for the reaction is 181 KJ mol^{-1} and does not change in the given range of temperature.
