Rule	Illustration
If the ring contains lesser number of carbon atoms than that of alkyl group attached to it, the compound is named as derivative of alkane and the ring is considered as a substituent group to the alkane, otherwise it is named as derivative of cycloalkane	 Propan-2-ylcyclobutane (derivative of cycloalkane)  2-Cyclopropylbutane (derivative of alkane)  ·Chlorocyclobut-1-ene ouble bond get prefernce over substituent-Cl for numbering)
If the side chain contains a multiple bond or a functional group, then the alicyclic ring is treated as the substituent irrespective of the size of the ring	 2-cyclobutylpropanal  3-cyclohexylpentan-2-one
If the alicyclic ring contains a multiple bond and the side chain contains a functional group the compound is named as derivative of the side chain and the ring is treated as substituent	 2-(cyclobut-2-en-1-yl)-propanal  4-(cyclopent-3-en-1-yl)-3-methylbutanoic acid
If both ring as well as the side chain contain the functional group, then parent hydrocarbon is decided on the basis of principal group which is further based on preferential order of functional groups	 3-(3-nitrocyclopentyl) - prop-2-enoicacid
