(ii) The Bitwise shift operators:

There are two bitwise shift operators in C++, **Shift left** (<<) and **Shift right** (>>).

Shift left (<<)– The value of the left operand is moved to left by the number of bits specified by the right operand. Right operand should be an unsigned integer.

Shift right (>>)– The value of the left operand is moved to right by the number of bits specified by the right operand. Right operand should be an unsigned integer.

Example:

If a =15; Equivalent binary value of a is 0000 1111

Operator	Operation	Result
<<	**a << 3**	 **(a<< 3) = 01111000$_2$= 120$_{10}$**
>>	**a >> 2**	 **(a>> 2) = 0000 0011$_2$= 3$_{10}$**

(iii) The Bitwise one's compliment operator:

The bitwise One's compliment operator **~(Tilde)**,inverts all the bits in a binary pattern, that is, all 1's become 0 and all 0's become 1. This is an unary operator.

Example:

If a =15; Equivalent binary values of a is 0000 1111

Operator	Operation	Result
~	**(~a)**	 **(~a) = 1111 0000$_2$= -16$_{10}$**
