www.tntextbooks.in

Variables that are of the same type can be initialized in a single statement.

Example:

int x1 = -1, x2 = 1, x3, n;

9.13.3 Dynamic Initialization:

A variable can be initialized during the execution of a program. It is known as "Dynamic initialization". For example,

int num1, num2, sum;

sum = num1 + num2;

The above two statements can be combined into a single one as follows:

int sum = num1+num2;

This initializes sum using the known values of num1 and num2 during the execution.

Illustration 9.7 C++ Program to illustrate dynamic initializetion

```
#include <iostream>
using namespace std;
int main()
{
        int num1, num2;
        cout << "\n Enter number 1: ";
        cin >> num1;
        cout << "\n Enter number 2: ";
        cin >> num2;
        int sum = num1 + num2; // Dynamic initialization
        cout << "\n Average: " << sum /2;
}
```

Output:

Enter number 1: 78
Enter number 2: 65
Average: 71
