www.tntextbooks.in

setprecision ( ) prints the values from left to right. For the above code, first, it will take 4 digits and then prints one digit from fractional portion.

setprecision can also be used to **set the number of decimal places to be displayed**. In order to do this task, you will have to set an ios flag within **setf()** manipulator. This may be used in two forms: (i) **fixed** and (ii) **scientific**

These two forms are used when the keywords fixed or scientific are appropriately used before the setprecision manipulator.

Example:

```
#include <iostream>

#include <iomanip>

using namespace std;

int main()

{

    cout.setf(ios::fixed);

    cout << setprecision(2)<<0.1;

}
```

In the above program, ios flag is set to **fixed** type; it prints the floating point number in fixed notation. So, **the output will be, 0.10**

```
cout.setf(ios::scientific);

cout << setprecision(2) << 0.1;
```

In the above statements, ios flag is set to **scientific type;** it will print the floating point number in scientific notation. So, **the output will be, 1.00e-001**

9.15 Expression:

An expression is a combination of operators, constants and variables arranged as per the rules of C++. It may also include function calls which return values. (Functions will be learnt in upcoming chapters).
