www.tntextbooks.in

In the above program, operand **a** is an int type and **b** is a float type. During the execution of the program, int is converted into a float, because a float is wider than int. Hence, the output of the above program will be: **9.14**

The following Table 9.11 shows you the conversion pattern.

RHO / LHO	**char**	**short**	**int**	**long**	**float**	**double**	**long double**
char	int	int	int	long	float	double	long double
short	int	int	int	long	float	double	long double
int	int	int	int	long	float	double	long double
long	long	long	long	long	float	double	long double
float	float	float	float	float	float	double	long double
double	double	double	double	double	double	double	long double
long double	long double	long double	long double	long double	long double	long double	long double

(RHO – Right Hand Operand; LHO – Left Hand Operand)

Table 9.11: Implicit conversion of mixed operands
