Table 9.12 – Explicit Conversion Problems

Example:

```
#include <iostream>
using namespace std;
int main()
{
        double varf=178.25255685;
        cout << (float) varf << endl;
        cout << (int) varf << endl;
}
```

Output:

178.253
178

Evaluate Yourself

1. What is meant by type conversion?
2. How implicit conversion different from explicit conversion?
3. What is difference between endl and \n?
4. What is the use of references?
5. What is the use of setprecision ( ) ?

Hands on practice:

1. Write C++ programs to interchange the values of two variables.
   a. Using with third variable
   b. Without using third variable
2. Write C++ programs to do the following:
   a. To find the perimeter and area of a quadrant.
   b. To find the area of triangle.
   c. To convert the temperature from Celsius to Fahrenheit.
