www.tntextbooks.in

```
{
        statement1;
        statement2;
        statement3;
}
```

For example

```
{
        int x, y;
        x = 10;
        y = x + 10;
}
```

The compound statement or block is a treated as a single unit and may be appear anywhere in the program.

10.3 Control Statements

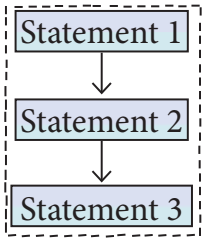
Control statements are statements that alter the sequence of flow of instructions.

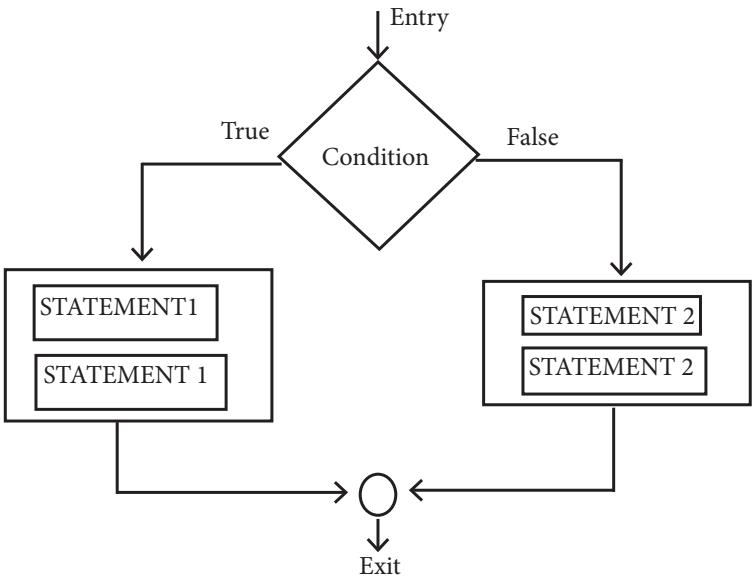
Selection statement

In a program, statements may be executed sequentially, selectively or iteratively. Every programming languages provides statements to support sequence, selection (branching) and iteration.

If the Statements are executed sequentially, the flow is called as sequential flow. In some situations, if the statements alter the flow of execution like branching, iteration, jumping and function calls, this flow is called as control flow.

Sequence statement





The **sequential statement** are the statements, that are executed one after another only once from top to bottom. These statements do not alter the flow of execution. These statements are called as sequential flow statements. They are always end with a semicolon (;).
