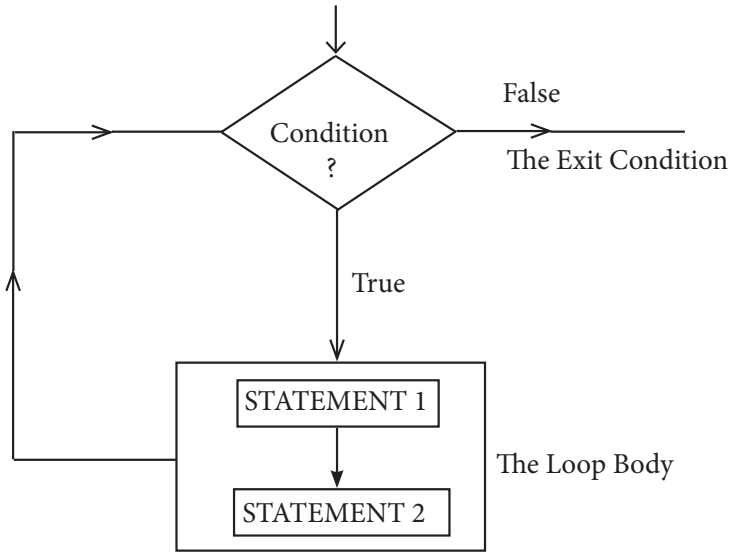
The selection statement means the statement (s) are executed depends upon a condition. If a condition is true, a true block (a set of statements) is executed otherwise a false block is executed. This statement is also called **decision statement** or **selection statement** because it helps in making decision about which set of statements are to be executed.

Iteration statement



The **iteration statement** is a set of statement are repetitively executed depends upon a conditions. If a condition evaluates to true, the set of statements (true block) is executed again and again. As soon as the condition becomes false, the repetition stops. This is also known as **looping statement** or iteration statement.

The set of statements that are executed again and again is called the **body of the loop.** The condition on which the execution or exit from the loop is called **exit-condition** or **test-condition.**

Generally, all the programming languages supports this type of statements to write programs depends upon the problems. C++ also supports this type of statements. These statements will be discussed in coming sections.

In selection statements and iteration statements are executed depends upon the conditional expression. The conditional expression evaluates either true or false.

Note

Note:

In C++, any **nonzero is treated as true including negative numbers and zero is treated as false.**
