In the above syntax, the expression 1 is a condition which is evaluated, if the condition is true (Non-zero), then the control is transferred to expression 2, otherwise, the control passes to expression 3.

Illustration 10.7 – C++ program to find greatest of two numbers using conditional operator

```
#include <iostream>
using namespace std;
int main()
{
        int a, b, largest;
        cout << "\n Enter any two numbers: ";
        cin >> a >> b;
         largest = (a>b)? a : b;
        cout << "\n Largest number : " << largest;
        return 0;
}
```

Output:

```
Enter any two numbers: 12 98
Largest number : 98
```

10.4.6 Switch statement

The switch statement is a multi-way branch statement. It provides an easy way to dispatch execution to different parts of code based on the value of the expression. The switch statement replaces multiple if-else sequence.

The syntax of the switch statement is;

```
switch(expression)
{
        case constant 1:
                statement(s);
                break;
        case constant 2:
                statement(s);
                break;
        .
        .
        .
        .
        default:
                statement(s);
}
```
