```
cout << "\n Your grade is " << grade;
        return 0;
}
```

Output:

```
Enter Grade: C
Welldone ...
Your grade is C
```

10.4.7 Switch vs if-else

"if-else" and "switch" both are selection statements. The selection statements, transfer the flow of the program to the particular block of statements based upon whether the condition is "true" or "false". However, there are some differences in their operations. These are given below:

Key Differences Between if-else and switch

1. Expression inside if statement decide whether to execute the statements inside if block or under else block. On the other hand, expression inside switch statement decide which case to execute.

2. An if-else statement uses multiple statements for multiple choices. On other hand, switch statement uses single expression for multiple choices.

3. If-esle statement checks for equality as well as for logical expression. On the other hand, switch checks only for equality.

4. The if statement evaluates integer, character, pointer or floating-point type or Boolean type. On the other hand, switch statement evaluates only character or a integer data type.

5. Sequence of execution is like either statement under if block will execute or statements under else block statement will execute. On the other hand the expression in switch statement decide which case to execute and if do not apply a break statement after each case it will execute till the end of switch statement.

6. If expression inside if turn out to be false, statement inside else block will be executed. If expression inside switch statement turn out to be false then default statements are executed.

7. It is difficult to edit if-else statements as it is tedious to trace where the correction is required. On the other hand, it is easy to edit switch statements as they are easy to trace.

The if statement is more flexible than switch statement.
