Some important things to know about switch

There are some important things to know about switch statement. They are

1. A switch statement can only work for quality of comparisons.
2. No two case labels in the same switch can have identical values.
3. If character constants are used in the switch statement, they are automatically converted to their equivalent ASCII codes.
4. The switch statement is more efficient choice than if in a situation that supports the nature of the switch operation.

Tips: The switch statement is more efficient than if-else statement.

10.4.8 Nested switch

When a switch is a part of the statement sequence of another switch, then it is called as nested switch statement. The inner switch and the outer switch constant may or may not be the same.

The syntax of the nested switch statement is;

```
switch (expression)
{
        case constant 1:
        statement(s);
        break;
                switch(expression)
                {
                case constant 1:
                        statement(s);
                        break;
                case constant 2:
                        statement(s);
                        break;
                        .
                        .
                        .
                default :
                statement(s);
        }
case constant 2:
statement(s);
break;
        .
        .
        .
default :
statement(s);
}
```
