www.tntextbooks.in

In the above statement **while (++i < 10),** first increment the value of i, then the value of i is compared with 10.

```
int main()

{

        int i=1;

        while( i++  < 10)

        cout<< "The value of i is "<<i;

        return 0;

}
```

In the above statement while (i++ < 10), first the value of i is compared with 10 and then the incrementation of i takes place. When the control reaches cout<< "The value of i is "<<i statement, i has already been incremented.

10.5.4 do-while loop

The do-while loop is an exit-controlled loop. In do-while loop, the condition is evaluated at the bottom of the loop after executing the body of the loop. This means that the body of the loop is executed at least once, even when the condition evaluates false during the first iteration.

The do-while loop syntax is:

```
do
{
        Body of the loop;

} while(condition);
```
