```
else
cout<<i<< " ";
}
return 0;
}
```

Output

1 2 3 4 5 7 8 9 10

In the above example, the loop will iterate 10 times but, if i reaches 6, then the control is transferred to for loop, because of the continue statement.

Difference between Break and Continue

Break	Continue
Break is used to **terminate** the execution of the loop.	Continue is not used to terminate the execution of loop.
It **breaks** the iteration.	It **skips** the iteration.
When this statement is executed, control will come out from the loop and executes the statement immediate after loop.	When this statement is executed, it will not come out of the loop but moves/jumps to the next iteration of loop.
Break is used with loops as well as switch case.	Continue is only used in loops, it is not used in switch case.

Hands on practice:

Write C++ program to slove the following problems :

1. Tempeature - conversion program that gives the user the option of converting Fahrenheit to Celsius or Celsius to Fahrenheit and depending upon user's choice.
2. The program requires the user to enter two numbers and an operator. It then carries out the specified arithmetical operation: addition, subtraction, multiplication or division of the two numbers. Finally, it displays the result.
3. Program to input a character and to print whether a given character is an alphabet, digit or any other character.
