11.4.2.7. tolower()

This function is used to convert the given character into its lowercase. This function will return the lower case equivalent of the given character. If the given character itself is in lower case, the output will be the same.

Syntax:

char tolower(char c);

The following statement will assign the character constant '**k**' to the variable c.

char c = tolower('K');

But, the output of the statement given below will be **'b'** itself.

cout <<tolower('b');

11.4.3 String manipulation (string.h)

The library **string.h** (also referred as cstring) has several common functions for dealing with strings stored in arrays of characters. The string.h header file to be included before using any string function.

11.4.3.1 strcpy()

The **strcpy()** function takes two arguments: target and source. It copies the character string pointed by the source to the memory location pointed by the target. The null terminating character **(\0)** is also copied.

Program 11.6

```
#include <string.h>
#include <iostream>
using namespace std;
int main()
{
        char source[] = "Computer Science";
        char target[20]="target";
        cout<<"\n String in Source Before Copied :"<<source;
        cout<<"\n String in Target Before Copied :"<<target;
        strcpy(target,source);
        cout<<"\n String in Target After strcpy function Executed :"<<target;
        return 0;
}
```
