Program 11.15

```
#include<iostream>
#include<cstdlib.h>
using namespace std;
int main()
{
        int random = rand(); /* No srand() calls before rand(), so seed = 1*/
        cout << "\nSeed = 1, Random number = " << random;
        srand(10);
        /* Seed = 10 */
        random = rand();
        cout << "\n\nSeed = 10, Random number = " << random;
        return 0;
}
```

OUTPUT :

```
        Seed = 1, Random number = 41
        Seed = 10, Random number = 71
```

11.5 User-defined Functions

11.5.1 Introduction

We can also define new functions to perform a specific task. These are called as user-defined functions. User-defined functions are created by the user. A function can optionally define input parameters that enable callers to pass arguments into the function. A function can also optionally return a value as output. Functions are useful for encapsulating common operations in a single reusable block, ideally with a name that clearly describes what the function does.

11.5.2 Function Definition

In C++, a function must be defined before it is used anywhere in the program. The general syntax of a function definition is:

Return_Data_Type Function_name(parameter list)

{

Body of the function

}
