www.tntextbooks.in

Though the above program is written in the normal function definition format during compilation the function code **(p1*n1*r1)/100** will be directly inserted in the calling statement i.e.**si=simpleinterest(p,n,r)**; this makes the calling statement to change as **si= (p1*n1*r1)/100;**

11.7 Different forms of User-defined Function declarations

11.7.1 A Function without return value and without parameter

The following program is an example for a function with no return and no arguments passed .

The name of the function is **display()**, its return data type is void and it does not have any argument.

Program 11.20

```
#include<iostream>
using namespace std;
void display()
{
        cout<<"First C++ Program with Function";
}
int main()
{
        display(); // Function calling statement//
        return(0);
}
```

Output :

```
First C++ Program with Function
```

11.7.2 A Function with return value and without parameter

The name of the function is **display()**, its return type is int and it does not have any argument. The **return** statement returns a value to the calling function and transfers the program control back to the calling statement.
