www.tntextbooks.in

```
        int &n1ref=n1;
        cout<<"\nThe Value of N1 = "<<n1<<" and n1Reference = "<<n1ref;
        n1ref++;
        cout<<"\nAfter n1 increased the Value of N1 = "<<n1;
        cout<<" and n1Reference = "<<n1ref;
        return(0);
}
```

Output:

The Value of N1 = 150 and n1Reference = 150
After n1 increased the Value of N1 = 151 and n1Reference = 151

Notes

The variable n1ref is alias to n1. Hence when the value of n1ref is altered automatically the value of n1 is changed.

The two variables n1 and n1ref shares same memory or reference.

11.9 Recursive Function

A function that calls itself is known as recursive function. And, this technique is known as recursion.

Example 1: Factorial of a Number Using Recursion

Program 11.26

```
#include <iostream>
using namespace std;
int factorial(int); // Function prototype //
int main()
{
        int no;
        cout<<"\nEnter a number to find its factorial: ";
        cin >> no;
        cout << "\nFactorial of Number " << no <<" = " << factorial(no);
        return 0;
}
```
