```
int factorial(int m)
{
        if (m > 1)
        {
        return m*factorial(m-1);
        }
        else
        {
        return 1;
}
}
```

Output :

```
Enter a number to find its factorial: 5
Factorial of Number 5 = 120
```

Note: Function prototype is mandatory since the function factorial() is given after the main() function.

Example 2: Finding HCF of any to number using Recursion

Program 11.27

```
#include <iostream>
using namespace std;
//Function to find HCF //
int hcf(int n1, int n2)
{
        if (n2 != 0)
        return hcf(n2, n1 % n2);
        else
        return n1;
}
int main()
{
        int num1, num2;
        cout << "Enter two positive integers: ";
        cin >> num1 >> num2;
        cout << "Highest Common Factor (HCF) of " << num1;
        cout<< " & " <<  num2 << " is: " << hcf(num1, num2);
        return 0;
}
```
