www.tntextbooks.in

Output:

Enter two positive integers: 350 100

Highest Common Factor (HCF) of 350 & 100 is: 50

Notes

Function prototype is not necessary since the function hcf() is given before the main() function.

11.10 Scope Rules of Variables

Scope refers to the accessibility of a variable. There are four types of scopes in C++. They are: **Local scope, Function scope, File scope** and **Class scope**.

11.10.1 Introduction

A scope is a region or life of the variable and broadly speaking there are three places, where variables can be declared,

- Inside a block which is called local variables.
- Inside a function is called function variables.
- Outside of all functions which is called global variables.
- Inside a class is called class variable or data members.

11.10.2 Local Scope:

- A local variable is defined within a block.A block of code begins and ends with curly braces { }.
- The scope of a local variable is the block in which it is defined.
- A local variable cannot be accessed from outside the block of its declaration.
