www.tntextbooks.in

```
// Accessing array elements
#include <iostream>
using namespace std;
int main()
{
        int num[5] = {10, 20, 30, 40, 50};
        int t=2;
        cout<<num[2] <<endl; // S1
        cout<<num[3+1] <<endl; // S2
        cout<<num[t=t+1]; // S3
}
output:
30
50
40
```

In the above program, statement **S1** displays the value of the 3rd element (subscript index 2). **S2** will display the value of the 5th element (ie. Subscript value is 3+1 = 4). In the same way statement **S3** will display the value of the 4th element.

The following program illustrates the writing and reading of array elements.

```
//Program to read and write the values from an array
#include <iostream>
using namespace std;
int main()
 {
        int age[4];//declaration of array
        cout<< "Enter the age of four persons:" <<endl;
        for(int i = 0; i < 4; i++)//loop to write array elements
                cin>> age[i];
        cout<<"The ages of four persons are:";
for(int j = 0; j< 4; j++)
                cout<< age[j]<<endl;
}
```

The following table shows the execution of the above code lines
