12.6 Passing 2"D array to a function

C++ program to display values from two dimensional array

```
#include <iostream>
using namespace std;
void display (int n[3][2]);
int main()
{
        int num[3][2] = { {3, 4}, {9, 5}, {7, 1} };
        display(num);
        return 0;
}
void display(int n[3][2])
{
    cout << "\n Displaying Values" << endl;
        for (int i=0; i<3; i++)
        {
            for (int j=0; j<2; j++)
            {
                cout << n[i][j] << " ";
            }
        cout << endl << endl;
        }
}
```

Output:

```
Displaying Values
3 4
9 5
7 1
```

In the above program, the two-dimensional array num is passed to the function display() to produce the results.
