www.tntextbooks.in

Example:

```
struct Student

{

        long rollno;

        int age;

        float weight;

} ;
```

In the above declaration of the struct, three variables rollno,age and weight are used. These variables(data element)within the structure are called members (or fields). In order to use the Student structure, a variable of type Student is declared and the memory allocation is shown in figure 12.5

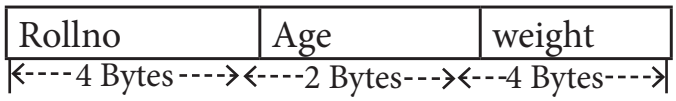

Fig 12.5 Memory Allocation

```
struct Student balu; // create a Student structure for Balu
```

This defines a variable of type Student named as Balu. Similar to normal variables, struct variable allocates memory for that variable itself. It is possible to define multiple variables of the same struct type:

```
struct Student frank; // create a structure  for Student Frank.
```

For example, the structure objects balu and frank can also be declared as the structure data type as:

```
struct Student

{

longrollno;

int age;

float weight;

}balu, frank;
```
