12.7.3 Referencing Structure Elements

Once the two objects of student structure type are declared (balu and frank),their members can be accessed directly. The syntax for that is using a dot (.) between the object name and the member name. For example, the elements of the structure Student can be accessed as follows:

balu.rollno

balu.age

balu.weight

frank.rollno

frank.age

frank.weight

If the members are a pointer types then '→' is used to access the members. Let name is a character pointer ins student like char * name
It can be accessed student → name

(Anonymous Structure Vs Named Structure)
A structure without a name/tag is called anonymous structure.

```
struct
{
long rollno;
        int age;
        float weight;
} student;
```

The student can be referred as reference name to the above structure and the elements can be accessed like student.rollno, student.age and student.weight .

12.7.4 Initializing structure elements

Values can be assigned to structure elements similar to assigning values to variables.

Example

```
balu.rollno= "702016";

balu.age= 18;

balu.weight= 48.5;
```

Also, values can be assigned directly as similar to assigning values to Arrays.

```
balu={702016, 18, 48.5};
```
