www.tntextbooks.in

```
Enter the height:
164.5
Enter the weight:
61.5
.....
.....
The values entered  for Age, height and weight are
Student 1       18       160.5            46.5
Student 2       18       164.5            61.5
.....
```

The above program reads age , height and weight of 20 students and prints the same details. The output is shown for only two students due to space constraints.

Let an organization has three employees.If we want to read and print all their details thenan array of structures is desirable for employees of this organization. This canbe done through declaring an array of employee structures.

```
include<iostream>
using namespace std;
struct Employee
{
char name[50];
int age;
float salary;
};
int main()
{
Employee e1[3];
int i;
cout<< “Enter the details of 3 employees”<<endl;
for(i=0;i<3;i++)
{
        cout<< “Enter the details of Employee”<< i+1<<endl;
        cout<< "Enter name: ";
        cin>>e1[i].name;
```
