12.7.8 Passing structures to functions

A structure variable can be passed to a function in a similar way of passing any argument that is of built-in data type.

If the structure itself is an argument, then it is called “call by value”. If the reference of the structure is passed as an argument then it is called, “call by reference”.

1 Call by value.

When a structure is passed as argument to a function using call by value method,any change made to the contents of the structure variable inside the function to which it is passed do not affect the structure variable used as an argument.

Consider this example:

```
#include <iostream>
using namespace std;
struct Employee
{
char name[50];
int age;
float salary;
};
```
