```
#include <iostream>
using namespace std;
struct Employee {
char name[50];
int age;
float salary;
};
Employee readData(Employee);
void printData(Employee);
int main()
{
        Employee p;
        p = readData(p);
        printData(p);
return 0;
}
        Employee readData(Employee p) {
        cout<< "Enter Full name: ";
        cin.get(p.name, 50);
        cout<< "Enter age: ";
        cin>>p.age;
        cout<< "Enter salary: ";
        cin>>p.salary;
return p;
}
void printData(Employee p)
{
        cout<< "\nDisplaying Information." <<endl;
        cout<< "Name: " << p.name <<endl;
        cout<<"Age: " <<p.age<<endl;
        cout<< "Salary: " <<p.salary;
}
```

The output of the program is the same as that of the previous programme.

2 Call by reference

In this method of passing the structures to functions ,the address of a structure variable /object is passed to the function using address of(&) operator. So any change made to the contents of structure variable inside the function are reflected back to the calling function.
