```
#include <iostream>
using namespace std;
struct Employee {
char name[50];
int age;
float salary;
};
void readData(Employee &);
void printData(Employee);
int main()
{
        Employee p;
        readData(p);
        printData(p);
return 0;
}
void readData(Employee &p) {
        cout<< "Enter Full name: ";
        cin.get(p.name, 50);
        cout<< "Enter age: ";
        cin>>p.age;
        cout<< "Enter salary: ";
        cin>>p.salary;
}
void printData(Employee p)
{
        cout<< "\nDisplaying Information." <<endl;
        cout<< "Name: " << p.name <<endl;
        cout<<"Age: " <<p.age<<endl;
        cout<< "Salary: " <<p.salary;
}
```

Structures are usually passed by reference method because it saves the memory space and executes faster.

Output:

```
Enter Full name: Kumar
Enter age: 55
Enter salary: 34233.4
Displaying Information.
Name: Kumar
Age: 55
Salary: 34233.4
```

3 Returning Structures from Functions

A structure can be passed to a function through its object. Therefore, passing a structure to a function or passing a structure object to a function is the same because structure object represents the structure. Like a normal variable, structure variable(structure object) can be
