```

Points to Remember:

- Structure is a user-defined which has the combination of data items with different data types
- Structure is declared using the keyword 'struct'
- Structure elements are referenced using its object name followed by dot(.) operator and then the member name
- A structure without a name/tag is called anonymous structure.
- The structure elements can be initialized either by using separate assignment statements or at the time of declaration by surrounding its values with braces.
- A structure object can also be assigned to another structure object only if both the objects are of same structure type.
- The structure declared within another structure is called a nested structure
- A structure can contain array as its member element.
- Array of structure variable can also be created.
- Structures can be passed to a function either by call by value method or by call by reference method .Functions can also return structures or its references
