Easy Maintenance:

It is easy to maintain and modify existing code as new objects can be created with small differences to existing ones.

Security:

Using data hiding and abstraction only necessary data will be provided thus maintains the security of data.

13.5 Disadvantages of OOP

Size:

Object Oriented Programs are much larger than other programs.

Effort:

Object Oriented Programs require a lot of work to create.

Speed:

Object Oriented Programs are slower than other programs, because of their size.

Points to Remember:

- Paradigm means organizing principle of a program.It is an approach to programming.
- Procedural or Modular programming means a list of instructions were given and each instructions tell the computer to do something.
- Procedural programming aims more ate procedures. In this Programs are organized in the form of subroutines or sub programs
- Modular programming combines related procedures in a module and hides data under modules.
- Object Oriented programming Paradigm emphasizes on the data rather than the algorithm. It implements programs using classes and objects
- Class is a user defined data type. Class represents a group of similar objects.
- Objects are the basic unit of OOP.It represents data and associated function together in to a single unit.
- The mechanism by which the data and functions are bound together into a single unit is known as ENCAPSULATION. It implements abstraction .
- Abstraction refers to showing only the essential features without revealing background details
- Modularity is designing a system that is divided into a set of functional units that can be composed into a larger application.
- Polymorphism is the ability of a message or function to be displayed in more than one form.
- Inheritance is the technique of building new classes (derived class) from an existing class. The most important advantage of inheritance is code reusability.Inheritance is transitive in nature.
