www.tntextbooks.in

```
int main( )
{
Box b;          // object for class Box
b.setWidth(10.0);     // Use member function to set the width.
b.printWidth( );              //Use member function to print the width.
return 0;
}
```

Output:

The width of the box is... 10

Note

Declaring a member function having many statements, looping construct, switch or goto statement as inline is not advisable.

ACTIVITY 2

```
class area
{
        int s;
public:
        void calc();
};
```

Write an outline function definition for calc(); which finds the area of a square

Evaluate Yourself

1. Define a class in general and in C++'s context
2. What is the purpose of a class specifier?
3. Compare a structure and a class in C++ context.
4. Compare private and puplic access specifier.
5. What is non-inline member function? Write its syntax.

14.2 Creating Objects

A class specification just defines the properties of a class. To make use of a class specified, the variables of that class type have to be declared. The class variables are called *object*. Objects are also called as *instance* of class.

For example

student s;

In the above statement **s** is an instance of the class **student**.

Objects can be created in two methods,

(1) Global object

(2) Local object

(1) Global Object

If an object is declared outside all the function bodies or by placing their names immediately after the closing brace of the class declaration then it is called as *Global object*. These objects can be used by any function in the program
