14.12 Declaration and Definition

When an instance of a class comes into scope, a special function called the *constructor* gets executed. The constructor function name has the same name as the class name. The constructors return nothing. They are not associated with any data type. It can be defined either inside class definition or outside the class definition.

Example 1:

Illustration 14.14 A constructor defined inside the class specification.

```
#include<iostream>
using namespace std;
class Sample
        {
int i,j;
            public :
int k;
              Sample()
              {
                 i=j=k=0;//constructor defined inside the class
              }
        };
```

Illustration 14.15 A constructor defined inside the class specification.

```
#include<iostream>
using namespace std;
class Sample
        {
int i,j;
            public :
int k;
              Sample()
              {
                 i=j=k=0;//constructor defined inside the class
              }
        };
int main()
{
Samples1;
      return 0;
}
```

Output:
