ACTIVITY 6

In the above program justify your reason for no output

Example 2:

Illustration 14.16 A constructor defined outside the class specification.

```
#include<iostream>
using namespace std;
class Data
        {
int p,q;
            public :
int r;
              Data();     //only prototype to be specified here to intimate its access
                                                                          specifier
       };
Data ::Data()
{
       p=q=r=0;              // constructor defined outside the class
 }
int main()
{
     Data d1;
return 0;
}
```

Note

A constructor can be defined either in private or public section of a class. But it is advisable to defined in public section of a class ,so that its object can be created in any function.
