Illustration 14.18 illustrate a member function initializes the data member.

```
#include<iostream>
using namespace std;
class Sample
 {
        int i, j;
        public :
        int k;
        void getvalue()
        {
                i=j=k=0;            //member function
        }
  };
int main()
{
Sample s1;
    s1.getvalue();              //member function initializes the class object
return 0;
}
```

After creating the object the getvalue() should be explicitly called to initialize the object.

14.12.2 Default Constructors

A constructor that accepts no parameter is called default constructor. For example in the class data program Data ::Data() is the default constructor . Using this constructor Objects are created similar to the way the variables of other data types are created.

Example

```
int num;       //ordinary variable declaration
 Data d1;      // object declaration
```

If a class does not contain an explicit constructor (user defined constructor) the compiler automatically generate a default constructor implicitly as an inline public member.
