www.tntextbooks.in

```
        void getdata()
        {
                cout<<"\n Enter values for a and b (sample data 6 and  7)... ";
                cin>>a>>b;
        }
        void putdata()
        {
                cout<<"\nThe two integers are... "<<a<<'\t'<< b<<endl;
                cout<<"\n The sum of the variables "<<a<<" + "<<b<<" = "<<a+b;
        }
};
int main()
{
        simple s;
        s.getdata();
        s.putdata();
        return 0;
}
```

Output:

```
 Constructor of class-simple
 Enter values for a and b (sample data 6 and  7)... 6 7
The two integers are... 6       7
 The sum of the variables 6 + 7 = 13
```

14.12.3 Parameterized Constructors

A constructor which can take arguments is called parameterized constructor .This type of constructor helps to create objects with different initial values. This is achieved by passing parameters to the function.

Illustration 14.21 to illustrate the Parameterized constructor used for creating objects

```
#include<iostream>
using namespace std;
class simple
{
private:
  int a,b;
public:
simple(int m, int n)
{
```
