www.tntextbooks.in

```
        cout<<"\nEnter the Roll Number";
        cin>>a;
        cout<<"\nEnter the Average";
        cin>>b;
        X x(a,b);       // dynamic initialization
        x.disp();
        return 0;
}
```

**Output:**

```
Enter the Roll Number 1201
Enter the Average 98.6
 Roll numbe:- 1201
Average :- 98.6
```

## 14.18 Characteristics of Constructors

- The name of the constructor must be same as that of the class
- No return type can be specified for constructor
- A constructor can have parameter list
- The constructor function can be overloaded
- They cannot be inherited but a derived class can call the base class constructor
- The compiler generates a constructor, in the absence of a user defined constructor.
- Compiler generated constructor is public member function
- The constructor is executed automatically when the object is created
- A constructor can be used explicitly to create new object of its class type

## 14.19 Destructors

When a class object goes out of scope, a special function called the *destructor* gets executed. The destructor has the same name as the class tag but prefixed with a **~(tilde)**. Destructor function also return nothing and it does not associated with anydata type.

### 14.19.1 Need of Destructors

The purpose of the destructor is to free the resources that the object may have acquired during its lifetime. A destructor function removes the memory of an object which was allocated by the constructor at the time of creating a object.
