Output

Enter the value of length and breath 10 20

Non Parameterizd constructor

perimeter of rectangle is 60

Parameterizd constructor with one argument

perimeter of rectangle 8

Parameterizd constructor with 2 argument

perimeter of rectangle 10

copy constructor

perimeter of rectangle 10

15.4 Operator overloading

The term operator overloading, refers to giving additional

functionality to the normal C++ operators like +,++,-,—,+=,-=,*.<,>. It is also a type of polymorphism in which an operator is overloaded to give user defined meaning to it .

For example '+' operator can be overloaded to perform addition on various data types, like for Integer, String(concatenation) etc.

Almost all operators can be overloaded in C++. However there are few operator which can not be overloaded. Operator that are not overloaded are follows

- scope operator **::**
- sizeof
- member selector **.**
- member pointer selector *****
- ternary operator **?:**
