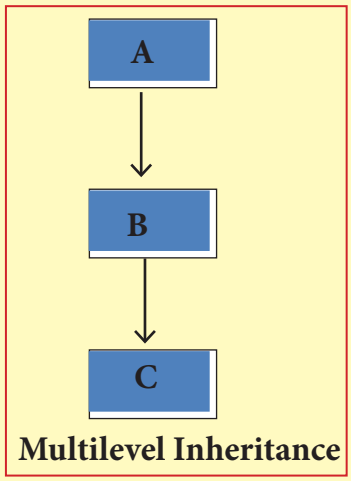
16.4.3 Multilevel Inheritance

Illustration 16.3 single inheritance

```
# include <iostream>
using namespace std;
class student            //base class
{
private :
char name[20];
int rno;
public:
void acceptname()
{
cout<<"\n Enter roll no and name .. ";
cin>>rno>>name;
}
void displayname()
{
cout<<"\n Roll no :-"<<rno;
cout<<"\n Name :-"<<name<<endl;
}};
 class exam : public student          //derived class with single base class
{
        public:
        int  mark1, mark2 ,mark3,mark4,mark5,mark6;
        void acceptmark()
        {
        cout<<"\n Enter lang,eng,phy,che,csc,mat marks.. ";
        cin>>mark1>>mark2>>mark3>>mark4>>mark5>>mark6;
        }
void displaymark(){
cout<<"\n\t\t Marks Obtained ";
cout<<"\n Language... "<<mark1;
cout<<"\n English... "<<mark2;
cout<<"\n Physics... "<<mark3;
cout<<"\n Chemistry... "<<mark4;
cout<<"\n Comp.sci... "<<mark5;
cout<<"\n Maths...  "<<mark6;
}
 };
```

In multilevel inheritance a derived class itself acts as a base class to derive another class.



Multilevel Inheritance
