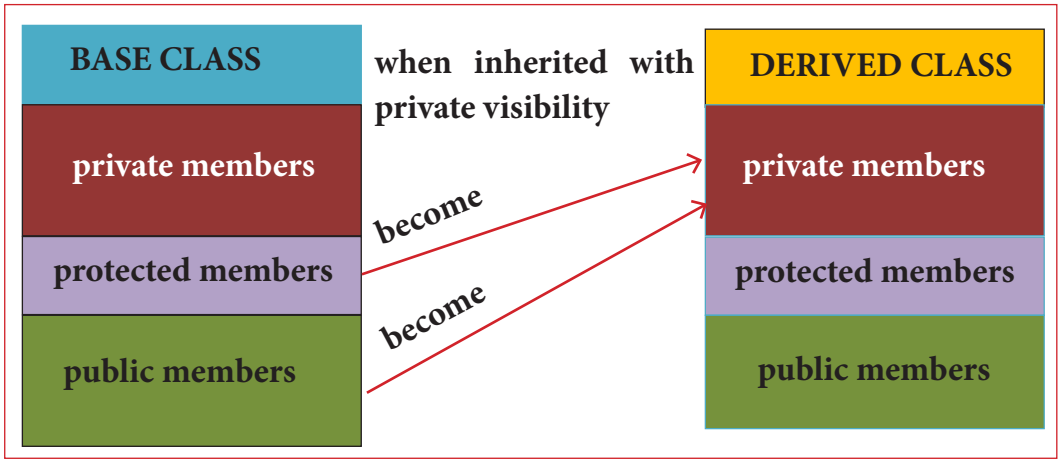
16.5 VISIBILITY MODES

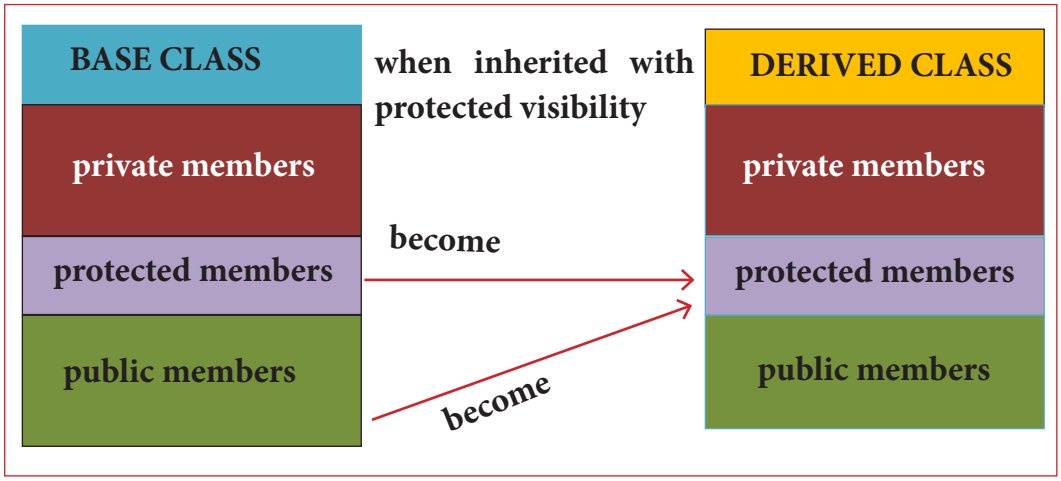
An important feature of Inheritance is to know which member of the base class will be acquired by the derived class. This is done by using visibility modes.

The accessibility of base class by the derived class is controlled by visibility modes. The three visibility modes are private, protected and public. The default visibility mode is private. Though visibility modes and access specifiers look similar, the main difference between them is Access specifiers control the accessibility of the members with in the class where as visibility modes control the access of inherited members with in the class.

16.5.1 Private visibility mode

When a base class is inherited with private visibility mode the public and protected members of the base class become 'private' members of the derived class



16.5.2 protected visibility mode


When a base class is inherited with protected visibility mode the protected and public members of the base class become 'protected members ' of the derived class
