16.8 Overriding / Shadowing Base class functions in derived class

In case of inheritance there are situations where the member function of the base class and derived classes have the same name. If the derived class object calls the overloaded member function it leads confusion to the compiler as to which function is to be invoked. The derived class member function have higher priority than the base class member function.This shadows the member functionof the base class which has the same name like the member function of the derived class. The scope resolution operator resolves this problem.

Illustration 16.11 the use of scope resolution operator in derived class

```
#include<iostream>
#include<string>
using namespace std;
class Employee
{
   private:
      char name[50];
      int code;
   public:
      void getdata();
      void display();
};
class staff: public Employee
{
   private:
      int ex;
   public:
         void getdata();
      void display();
};
void Employee::display()
{
         cout<<"Name:"<<name<<endl;
         cout<<"Code:"<<code<<endl;
}
```
