```
void staff::display()
{
        Employee :: display();//overriding
        cout<<"Experience:"<<ex<<" Years"<<endl;
}
int main()
{
        staff s;
        cout<<"Enter data"<<endl;
        s.getdata();
        cout<<endl<<endl<<"\tDisplay Data"<<endl;
        s.display();
        return 0;
}
```

Output

```
Enter data
Name: SUGANYA
Code: 1201
Experience: 30
      Display Data
Name: SUGANYA
Code:1201
Experience:30 Years
```

In the above program getdata() and display() are defined both in base and in derived class. So when the derived class staff inherits the properties of Employee class it will have two getdata() and display() each. To differentiate the derived getdata() and display() from the defined getdata() and display() :: (scope resolution) operator is given along with the base class name to the base class members
