Some of the examples for Huckel rule

1.	 **Benzene**	(i) The benzene is a planar molecule (ii) It has six deloclaised π electorns (iii) 4n + 2 = 6 4n = 6- 2 4n = 4 n = 1 it obeys Huckel's (4n+2) π electron rule with n = 1 hence, benzene is aromatic.
2.	 **Naphthalene**	(i)Naphthalene has a planar ring structure (ii) It has 10 delocalised π electrons (ii) 4n + 2 = 10 4n = 10- 2 4n = 8 n = 8/4 = 2 hence, naphthalene is aromatic.
3.	 **Anthracene**	It has a planar ring structure with 14 delocalised π electrons. Applying Huckel's rule 4n+2=14π electrons. n=3 Hence it is an aromatic compound
4.	 **Cyclo penta diene**	(i) It has planar structure (ii) It has four π electron but the π electrons are not delocalised and hence it is not an aromatic compound
5.	 **Cyclooctatetraene**	molecule is non planar and hence it is not an aromatic compund
6	 **Cyclopropenylcation**	(i) cyclopropenyl cation has planar structure (ii) It has 2 delocalised π electron. (ii) 4n + 2 = 2 4n = 0 n = 0 (an interger) and hence it is aromatic compound.
